

Measuring Your French 4 Door Refrigerator

Notes:

- For the Depth of your fridge (measurement **P**), measure the body of the refrigerator only - measure the depth of the doors (measurement **O**) separately.

- For Measurement **O** (door depth), measure at the thickest point (should be the center of the door). Also check this measurement on the inside edge of the top doors - they should be the same, or very close to the same.

- For $H^{1/2/3}$ measurements (door handles), measure from the edge of the door inwards to the farthest edge of the door handle - this helps us account for door handles that aren't mounted flush to the edge of the door. For $J^{1/2/3}$ measurements, measure the length of the door that the handles cover at the farthest points. Do not measure the handles along their raised (curved) areas, as that will give a false (longer) measurement.

- If your refrigerator doesn't have an ice/water dispenser, ignore measurements **K**, **L**, **M**, and **N**
